# NeoColab\_REC\_CS23231\_DATA STRUCTURES

REC\_DS using C\_Week 7\_COD\_Question 4

Attempt : 1 Total Mark : 10 Marks Obtained : 10

Section 1 : Coding

#### 1. Problem Statement

Develop a program using hashing to manage a fruit contest where each fruit is assigned a unique name and a corresponding score. The program should allow the organizer to input the number of fruits and their names with scores.

Then, it should enable them to check if a specific fruit, identified by its name, is part of the contest. If the fruit is registered, the program should display its score; otherwise, it should indicate that it is not included in the contest.

### **Input Format**

The first line consists of an integer N, representing the number of fruits in the contest.

The following N lines contain a string K and an integer V, separated by a space, representing the name and score of each fruit in the contest.

The last line consists of a string T, representing the name of the fruit to search for.

## **Output Format**

If T exists in the dictionary, print "Key "T" exists in the dictionary.".

If T does not exist in the dictionary, print "Key "T" does not exist in the dictionary.".

Refer to the sample outputs for the formatting specifications.

## Sample Test Case

Input: 2

```
banana 2
apple 1
Banana
Output: Key "Banana" does not exist in the dictionary.
Answer
unsigned int hashString(const char* key, int size) {
  unsigned int hash = 0;
  for (int i = 0; key[i] != '\0'; i++) {
    hash += (i + 1) * (unsigned char)key[i];
  return hash % size;
}
int keyExists(KeyValuePair* dictionary, int size, const char* key) {
  int index = hashString(key, size);
  int original_index = index;
  do {
    if (strcmp(dictionary[index].key, "") != 0) {
       if (strcmp(dictionary[index].key, key) == 0) {
         return 1:
```

```
}
} else {
    return 0;
}
index = (index + 1) % size;
} while (index != original_index);
return 0;
}
```

Status: Correct Marks: 10/10
